First degree polynomials have terms with a maximum degree of 1. In other words, you wouldn't usually find any exponents in the terms of a first degree polynomial. For example, the following are first degree polynomials: $2x + 1$, $xyz + 50$, $10a + 4b + 20$.

Polynomial Function: Definition, Examples, Degrees ...

Polynomials in one variable are algebraic expressions that consist of terms in the form $(a{x}^n)$ where (n) is a non-negative (i.e. positive or zero) integer and (a) is a real number and is called the coefficient of the term. The degree of a polynomial in one variable is the largest exponent in the polynomial.
