It's much more cost-effective to just order the bound paperback from Amazon.com This book includes original commentary which is copyright material. A Financial Times Best Book of the Year A “provocative” (Booklist) and compelling look at the powerful global forces that will cause billions of us to move geographically over the next decades, ushering in an era of radical change. In the 60,000 years since people began colonizing the continents, a recurring feature of human civilization has been mobility—the ever-constant search for resources and stability. Seismic global events—wars and genocides, revolutions and pandemics—have only accelerated the process. The map of humanity isn’t settled—not now, not ever. As climate change tips toward full-blown crisis, economies collapse, governments destabilize, and technology disrupts, we’re entering a new age of mass migrations—one that will scatter both the dispossessed and the well-off. Which areas will people abandon and where will they resettle? Which countries will accept or reject them? As today’s world population, which includes four billion restless youth, votes with their feet, what map of human geography will emerge? In Move, celebrated futurist Parag Khanna provides an illuminating and authoritative vision of the next phase of human civilization—one that is both mobile and sustainable. As the book explores, in the years ahead people will move people to where the resources are and technologies will flow to the people who need them, returning us to our nomadic roots while building more secure habitats. “An urgent, powerful argument for more open international borders” (Kirkus Reviews, starred review), Move is a fascinat-

ing look at the deep trends that are shaping the most likely scenarios for the future. Most important, it guides each of us as we determine our optimal location on humanity's ever-changing map. Collins Atlas Skills for CSEC® Geography is a workbook that provides practice in the skills needed for success in the CSEC® exam and SBA, including map-skills, field studies skills and the interpretation of geographical data.

Tularaemia is a bacterial zoonotic disease of the northern hemisphere. The bacterium (*Francisella tularensis*) is highly virulent for humans and a range of animals such as rodents hares and rabbits. Humans can infect themselves by direct contact with infected animals by arthropod bites by ingestion of contaminated water or food or by inhalation of infective aerosols. There is no human-to-human transmission. In addition to its natural occurrence *F. tularensis* evokes great concern as a potential bioterrorism agent. *F. tularensis* subspecies *tularensis* is one of the most infectious pathogens known in human medicine. In order to avoid laboratory-associated infection safety measures are needed and consequently clinical laboratories do not generally accept specimens for culture. However since clinical management of cases depends on early recognition there is an urgent need for diagnostic services. This first edition of WHO Guidelines on tularaemia provides background information on the disease describes the current best practices for its diagnosis and treatments in humans suggests measures to be taken in case of epidemics and provides guidance on how to handle *F. tularensis* in the laboratory. The target audience includes clinicians laboratory personnel public health workers veterinarians and any other person with an interest in zoonoses.

It has long been recognized that advances in science contribute to economic growth. While it is one thing to argue that such a relationship exists, it is quite another to establish the extent to which knowledge spills over within and between sectors of the economy. Such a research agenda faces numerous challenges. Not only must one seek measures of inputs, but a measure of output is needed as well to estimate the knowledge production function. The identification of such a mea-

sure was a compelling goal for Zvi Griliches, if not the holy grail: "The dream of getting hold of an output indicator of inventive activity is one of the strong motivating forces for economic research in this area." (Griliches 1990, p. 1669). Jaffe (1989) made a significant contribution to estimating the knowledge production function when he established a relationship between patent activity and R&D activity at the state level. Feldman and coauthors (1994a, 1994b) added considerably to this line of research, focusing on innovation counts as the dependent variable instead of patent counts. This work was particularly important given that many innovations are never patented. Feldman's work also differentiated by firm size and showed that knowledge spillovers from universities play a key role as sources of knowledge for small firms.

Volcanic eruptions are common, with more than 50 volcanic eruptions in the United States alone in the past 31 years. These eruptions can have devastating economic and social consequences, even at great distances from the volcano. Fortunately many eruptions are preceded by unrest that can be detected using ground, airborne, and spaceborne instruments. Data from these instruments, combined with basic understanding of how volcanoes work, form the basis for forecasting eruption-where, when, how big, how long, and the consequences. Accurate forecasts of the likelihood and magnitude of an eruption in a specified timeframe are rooted in a scientific understanding of the processes that govern the storage, ascent, and eruption of magma. Yet our understanding of volcanic systems is incomplete and biased by the limited number of volcanoes and eruption styles observed with advanced instrumentation. Volcanic Eruptions and Their Repose, Unrest, Precursors, and Timing identifies key science questions, research and observation priorities, and approaches for building a volcano science community capable of tackling them. This report presents goals for making major advances in volcano science.
